Regenerative Medicine in Facial Aesthetics

GET HEALTHIER, FIRMER AND GLOWING SKIN WITH PLATELET-RICH PLASMA THERAPY AND POLYNUCLEOTIDES.

Regenerative aesthetics is an emerging branch of regenerative medicine with therapies aimed at recapturing youthful structure and function using the body's own systems for natural repair and healing.

Regenerative treatments offer natural interventions which stimulate cell to cell communication to trigger rejuvenation and repair.

At around age 35, the effects of ageing start to become more pronounced, starting with skin changes. There is a decline in collagen, fibrin and hyaluronic acid with bone regression and changes in the facial fat pads. These changes lead to loss of volume and support for the overlying skin.

What regenerative aesthetics treatments does Doctor Farzana offer?

Using the power of cellular intelligence, with regenerative treatment we can bring back more structure and youthfulness to the face, which can can help restore skin laxity, radiance as well as improve skin volume.

Dr Farzana Khan

Doctor Farzana offers a variety of regenerative aesthetic treatments including PRP (platelet-rich plasma) and PN (polynucleotides) for face, hair and sexual rejuvenation.

Platelet-rich Plasma Therapy (PRP)

PRP therapy is an excellent treatment that uses a small amount of your own blood, which is placed into a centrifuge to separate growth hormone factors. This is a powerful way to heal skin, stimulate the production of collagen, new skin cells, as well as regenerate hair follicles.

Doctor Farzana is one of the few doctors in the North of England who also offers PRP for sexual rejuvenation, vaginal dryness, stress urinary incontinence and lichen sclerosis.

Smoothing wrinkles, contouring cheeks and volumizing skin are effective ways of rejuvenating the skin, but poor skin quality means that the results are as impressive as they could be.

Polynucleotides (PN)

Polynucelotides is an injectable regenerative medical treatment that stimulates collagen production and improves skin quality, skin elasticity and appearance. It heals sun-damaged skin, improve photoaging, acne scarring and rosacea. The result is a more nourished, healthy, and revitalised complexion. Polynucelotides work by stimulating the cells called fibroblast. These cells are responsible for production of collagen, which helps maintain the skins firm structure. It has become an increasing popular treatment for the under eye area which use to be difficult to treat with dermal filler in the past.

Doctor Farzana also offers polynucleotide for sexual rejuvenation to improve skin texture around women's intimate area.
